

# NNS in QF

Fred Viole

# Introduction to Partial Moments

Q. What are partial moments?

A. The elements of variance.

Univariate:

$$LPM(\textit{degree}, \textit{target}, \textit{variable}) = \frac{1}{T} \sum_{t=1}^T [\max(0, \textit{target} - \textit{variable}_t)]^{\textit{degree}}$$

$$UPM(\textit{degree}, \textit{target}, \textit{variable}) = \frac{1}{T} \sum_{t=1}^T [\max(0, \textit{variable}_t - \textit{target})]^{\textit{degree}}$$

Time-series or cross-sectional

# Partial Moment Equivalences

NNS.dep(x, y)
```

```
## $Correlation  
## [1] 0.9325653  
##  
## $Dependence  
## [1] 0.9325653
```

Compared to Mutual Information, Distance Correlation,  
Chatterjee's  $\xi$ ...

# Partitioning Also Led to:

## Nonlinear Regression

Offers dynamic bandwidth solution

# Multivariate Regression

- Similar to kNN regression... cluster centroids instead of observations
- $k$ -fold cross-validation for number of centroids

# Very good at extrapolation

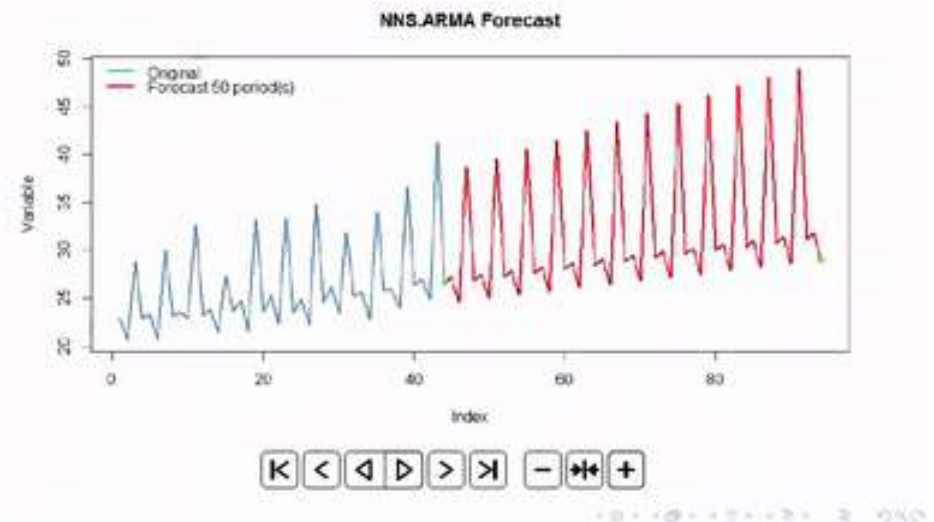

# Nonlinear Regression Led to Time-Series Forecasting:

Ultimately yielding:

# Time-Series Forecasting with Nonlinear Regression

NNS.ARMA Forecast

# Generative and Synthetic Data

## Maximum Entropy Bootstrap for Time-Series

- Specify a `rho` or `drift` for any replicate... ensures  $\rho \in [-1, 1]$  correlation spectrum is covered.
- Standard IID MC or block bootstrap cannot accomplish this.

# Static Drift

# Specify a Drift for Replicates (RfR seems useful!)

# Ultimately Led to This General Statistical Toolkit:

NNS version 10.9.6    licence GPL-3

NNS offers:

- Numerical Integration & Numerical Differentiation
- Partitional & Hierarchical Clustering
- Nonlinear Correlation & Dependence
- Causal Analysis
- Nonlinear Regression & Classification
- ANOVA
- Seasonality & Autoregressive Modeling
- Normalization
- Stochastic Dominance
- Advanced Monte Carlo Sampling

**Finance Applications?**  
**You bet!**

# Stress Testing

- Restrict observations to *CLPM* and use `NNS.reg()`, maintains dependence structure
- Reverse the procedure... instead of what happens to portfolio if S&P 500 drops 10%, what portfolio returns would lead to a 10% S&P 500 drop? Distribution of scenarios.

[https://github.com/OVVO-Financial/Finance/blob/main/stress\\_test.md](https://github.com/OVVO-Financial/Finance/blob/main/stress_test.md)

# Distribution of Losses

# Utility Theory

- Markowitz dedicated a quarter of his 1959 book to utility theory. Was it a waste of time? Absolutely not!
- Each of us has unique risk profiles, costs of capital, and preferences. Parsing variance to reflect these subjective interpretations is critical for representing individual preferences.
- Partial moments are the *perfect* method to achieve this. Summary statistics just don't cut it!

# Let's Revisit Degrees

$$LPM(\textcolor{red}{n}, \textcolor{blue}{target}, variable) = \frac{1}{T} \sum_{t=1}^T [\max(0, \textcolor{blue}{target} - variable_t)]^{\textcolor{red}{n}}$$

$$UPM(\textcolor{blue}{q}, \textcolor{blue}{target}, variable) = \frac{1}{T} \sum_{t=1}^T [\max(0, variable_t - \textcolor{blue}{target})]^{\textcolor{blue}{q}}$$

loss-aversion:  $\textcolor{red}{n}$

gain-seeking:  $\textcolor{blue}{q}$

# Utility Functions

NOBODY is linear ( $n = 1$ ) wrt losses!

Risk-aversion ( $n : q$ ) and loss-aversion ( $n$ ) are two distinct preferences

# Utility Embedded Into Covariance Matrix

## Covariance Elements and Covariance Matrix

The covariance matrix ( $\Sigma$ ) is equal to the sum of the co-partial moments matrices less the divergent partial moments matrices.

$$\Sigma = CLPM + CUPM - DLPM - DUPM$$

# Logical Objective Functions

Consistent objective for all risk preferences!

# SSD Efficient Set of S&P 500

# Expected Partial Moments

Longer post and paper link on conditioning returns via entropy proxies

# Other Portfolio “Theories”

- Diversification for its own sake, with no identified utility function or preference being satisfied.
- Hierarchical Risk Parity (HRP) aims to create portfolios that are more robust to input variations, avoiding extreme mean-variance allocations.
- Stochastic Portfolio Theory (SPT) values growth rates but ignores investor preferences — *how* you achieve final wealth matters!

# Options Pricing

An obvious extension is to use **UPM** for calls and **LPM** for puts

No more  $N(d1)$  and  $N(d2)$ !

# Partial Moments in the Wild

To showcase the effectiveness of NNS in quantitative finance, I've designed the following applications:

- MacroNow nowcasting  
[https://ovvo.shinyapps.io/macronow\\_intro](https://ovvo.shinyapps.io/macronow_intro)
- Options  
[https://ovvo.shinyapps.io/options\\_intro](https://ovvo.shinyapps.io/options_intro)
- Portfolio  
[https://ovvo.shinyapps.io/portfolio\\_intro](https://ovvo.shinyapps.io/portfolio_intro)

# More Informed Dispersion Measures

$$RD_t = \sqrt{\sum_{i=1}^N w_i (R_{i,t} - R_{I,t})^2}$$

where  $R_{I,t} = \sum_{i=1}^N w_i R_{i,t}$  for  $N$  index members

$$RD_t^{LPM} = \sqrt{\sum_{i=1}^N w_i [\max(0, R_{I,t} - R_{i,t})]^2}$$

$$RD_t^{UPM} = \sqrt{\sum_{i=1}^N w_i [\max(0, R_{i,t} - R_{I,t})]^2}$$
