### NNS in QF

Fred Viole

# Introduction to Partial Moments

### Q. What are partial moments?

#### A. The elements of variance.

#### **Univariate:**

$$LPM(egin{aligned} & LPM(egin{aligned} & degree, target, variable \end{aligned}) = rac{1}{T} \sum_{t=1}^{T} \left[ \max(0, target - variable_t) 
ight]^{degree} \end{aligned}$$

$$UPM(egin{aligned} egin{aligned} degree, target, variable ) = rac{1}{T} \sum_{t=1}^{T} \left[ \max(0, variable_t - target) 
ight]^{egin{aligned} degree} \end{aligned}$$

Time-series or cross-sectional

### Partial Moment Equivalences

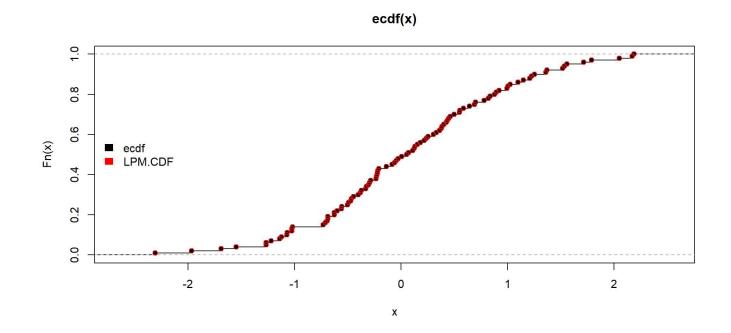

```
1 library(NNS)
           2 set.seed(123); x = rnorm(100); y = rnorm(100)
           4 \text{ mean}(x)
[1] 0.09040591
          1 UPM(degree = 1, target = 0, variable = x) - LPM(degree = 1, target = 0, variable = x)
[1] 0.09040591
           1 # Sample Variance (base R):
           2 \operatorname{var}(x)
[1] 0.8332328
           1 # Sample Variance:
           2 (UPM(2, mean(x), x) + LPM(2, mean(x), x)) * (length(x) / (length(x) - \frac{1}{2}))
[1] 0.8332328
           1 # Population Adjustment of Sample Variance (base R):
           2 \operatorname{var}(x) * ((\operatorname{length}(x) - 1) / \operatorname{length}(x))
[1] 0.8249005
           1 # Population Variance:
           2 UPM(\frac{2}{2}, mean(x), x) + LPM(\frac{2}{2}, mean(x), x)
[1] 0.8249005
           1 # Variance is also the co-variance of itself:
           2 {(Co.LPM(degree lpm = 1, x = x, y = x, target x = mean(x), target y = mean(x))
           3 + Co.UPM(degree upm = 1, x, x, mean(x), mean(x))
           4 - D.LPM(degree lpm = 1, degree upm = 1, x, x, mean(x), mean(x))
           5 - D.UPM(1, 1, x, x, mean(x), mean(x)))
```

[1] 0.8249005

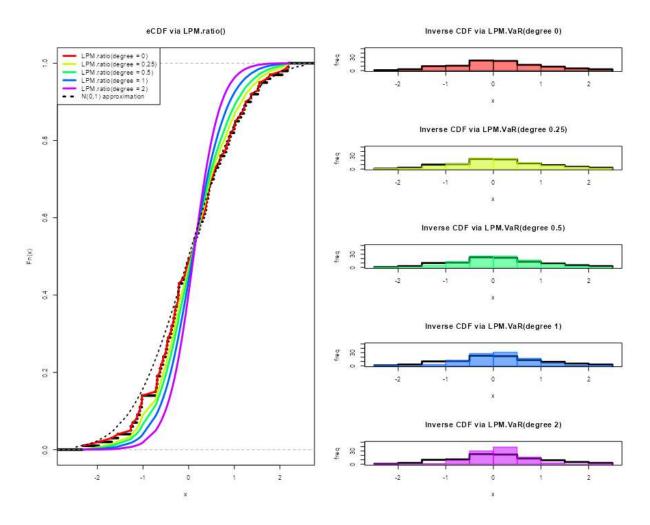

### More Equivalences

#### LPM degree 0 is the eCDF for any distribution

```
1 LPM.CDF = LPM(degree = 0, target = sort(x), variable = x)
2
3 plot(ecdf(x))
4 points(sort(x), LPM.CDF, col='red')
5 legend('left', legend = c('ecdf', 'LPM.CDF'), fill=c('black', 'red'),
```

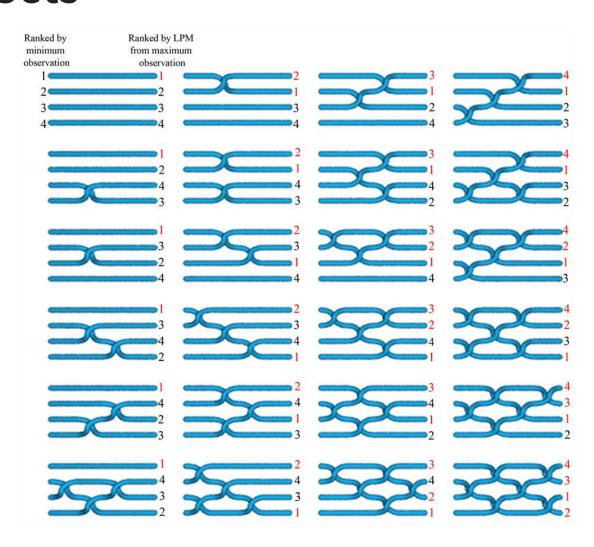

#### More CDFs and PDFs

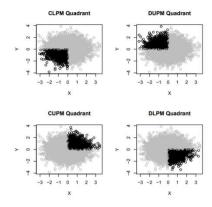

Still empirical CDFs, all we've done is increase the degree

### Comparing CDFs Led to Stochastic Dominant Efficient Sets

#### Multivariate

$$CLPM(degree, target, x, y) = rac{1}{T} \sum_{t=1}^{T} \left[ \max(0, target - x_t) 
ight]^{degree} \left[ \max(0, target - y_t) 
ight]^{degree}$$

$$CUPM(degree, target, x, y) = rac{1}{T} \sum_{t=1}^{T} \left[ \max(0, x_t - target) 
ight]^{degree} \left[ \max(0, y_t - target) 
ight]^{degree}$$

$$DLPM(degree, target, x, y) = rac{1}{T} \sum_{t=1}^{T} \left[ \max(0, x_t - target) 
ight]^{degree} \left[ \max(0, target - y_t) 
ight]^{degree}$$

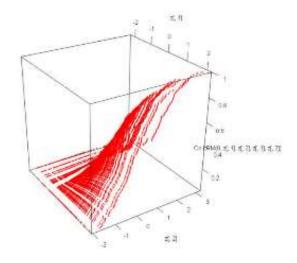

$$DUPM(degree, target, x, y) = rac{1}{T} \sum_{t=1}^{T} \left[ \max(0, target - x_t) 
ight]^{degree} \left[ \max(0, y_t - target) 
ight]^{degree}$$

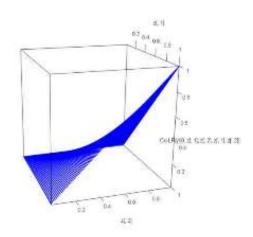

### **Covariance Equivalence**

```
Covariance Elements and Covariance Matrix
The covariance matrix (\Sigma) is equal to the sum of the co-partial moments matrices less the divergent partial moments matrices.
                                                \Sigma = CLPM + CUPM - DLPM - DUPM
                                                                                                                               P
 > cov.mtx = PM.matrix(LPM_degree = 1, UPM_degree = 1, target = 'mean', variable = cbind(x,y), pop_adj = TRUE)
 > cov.mtx
 x 0.4299250 0.1033601
 y 0.1033601 0.5411626
 x 0.0000000 0.1469182
 y 0.1560924 0.0000000
 x 0.0000000 0.1560924
  y 0.1469182 0.0000000
  x 0.4033078 0.1559295
 y 0.1559295 0.3939005
  Scov.matrix
  x 0.83323283 -0.04372107
  y -0.04372107 0.93506310
  # Reassembled Covariance Matrix
 > cov.mtx$cupm + cov.mtx$clpm - cov.mtx$dupm - cov.mtx$dlpm
 x 0.83323283 -0.04372107
 y -0.04372107 0.93506310
  # Standard Covariance Matrix
  > cov(cbind(x,y))
  x 0.83323283 -0.04372107
  y -0.04372107 0.93506310
```

### Copulas

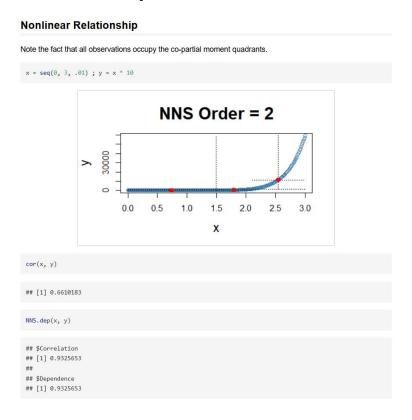

```
> # Data
> set.seed(123); x = rnorm(100); y = rnorm(100)
>
> # Raw values
> z = expand.grid(x, y)
>
> # Plot
> rgl::plot3d(z[,1], z[,2], Co.LPM(0, z[,1], z[,2], z[,1], z[,2]), col = "red")
>
> # Uniform values
> u_x = LPM.ratio(0, x, x)
> u_y = LPM.ratio(0, y, y)
> z = expand.grid(u_x, u_y)
>
> # Plot
> rgl::plot3d(z[,1], z[,2], Co.LPM(0, z[,1], z[,2], z[,1], z[,2]), col = "blue")
> | Plot
```

### Partitioning Led to:

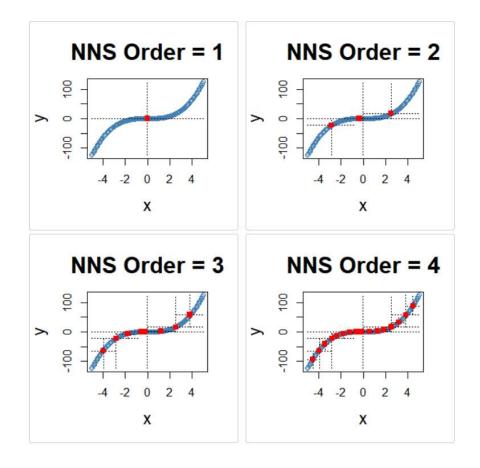

#### Nonlinear Correlation & Dependence

Compared to Mutual Information, Distance Correlation, Chatterjee's Xi...

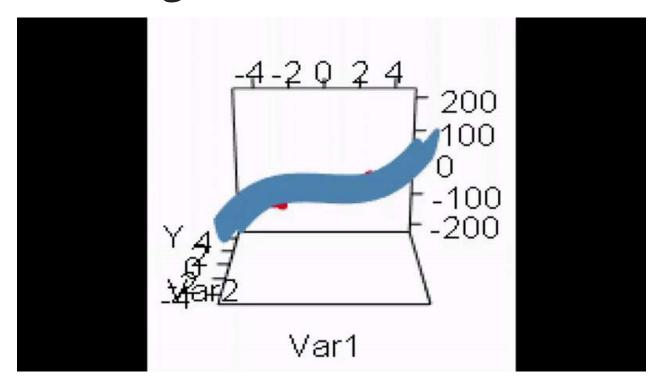

### Partitioning Also Led to:

**Nonlinear Regression** 

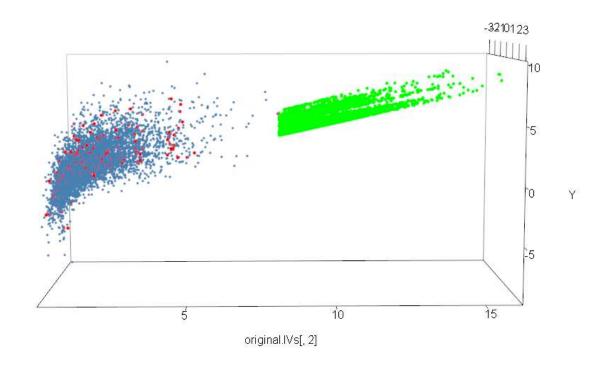

Offers dynamic bandwidth solution

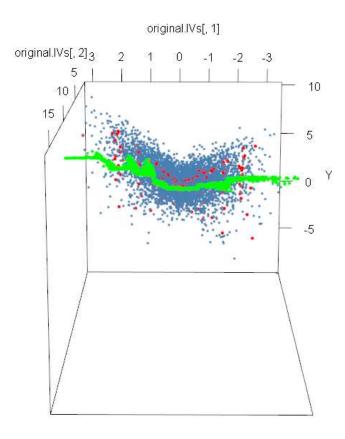

### **Multivariate Regression**

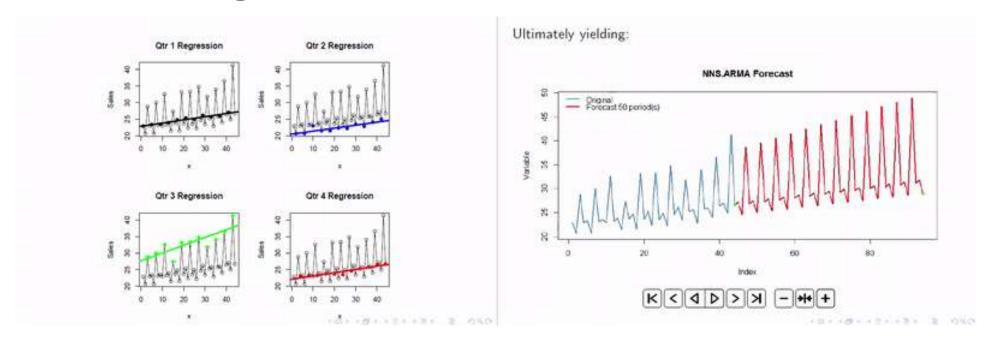

- Similar to kNN regression... cluster centroids instead of observations
- k-fold cross-validation for number of centroids

### Very good at extrapolation

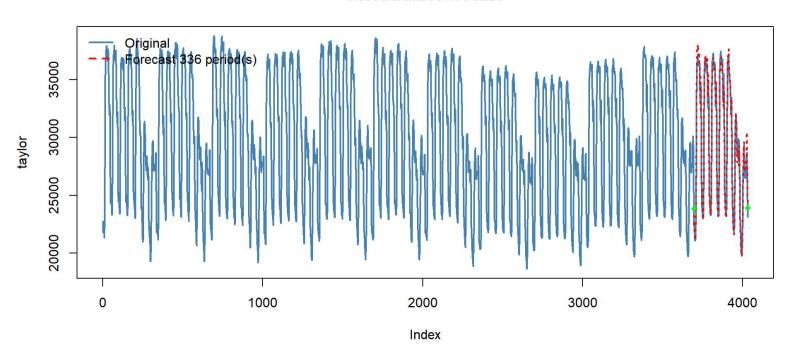

### Nonlinear Regression Led to Time-Series Forecasting:

### Time-Series Forecasting with Nonlinear Regression

#### **NNS.ARMA** Forecast

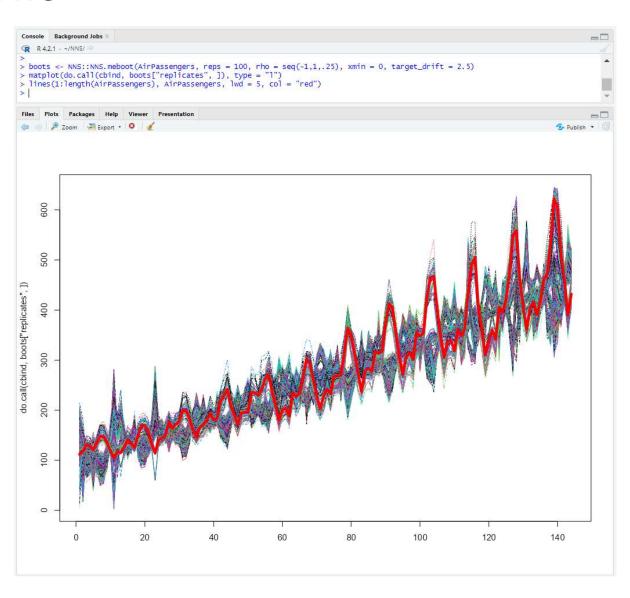

## Generative and Synthetic Data Maximum Entropy Bootstrap for Time-Series

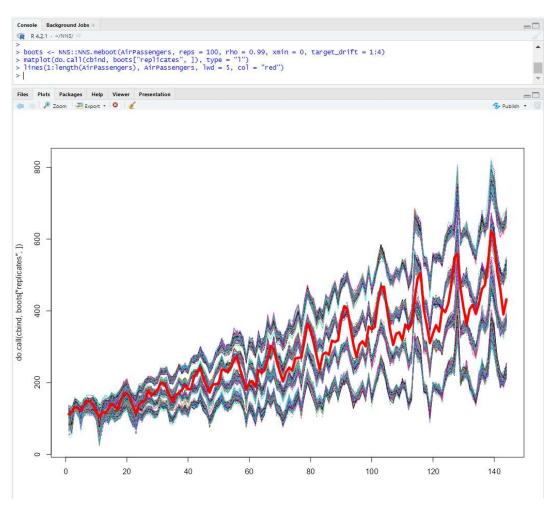

• Specify a rho or drift for any replicate... ensures  $\rho \in [-1,1]$  correlation spectrum is covered.

Standard IID MC or block bootstrap cannot accomplish this.

### **Static Drift**

## Specify a Drift for Replicates (RfR seems useful!)

### Ultimately Led to This General Statisical Toolkit:

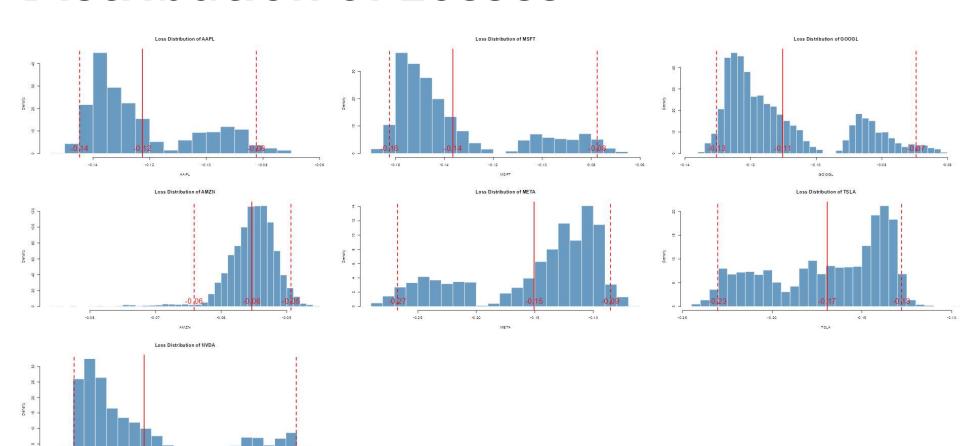

# Finance Applications? You bet!

### **Stress Testing**

- Restrict observations to CLPM and use NNS.reg(), maintains dependence structure
- Reverse the procedure... instead of what happens to portfolio if S&P 500 drops 10%, what portfolio returns would lead to a 10% S&P 500 drop? Distribution of scenarios.

https://github.com/OVVO-Financial/Finance/blob/main/stress\_test.md

### **Distribution of Losses**

### **Utility Theory**

- Markowitz dedicated a quarter of his 1959 book to utility theory. Was it a waste of time? Absolutely not!
- Each of us has unique risk profiles, costs of capital, and preferences. Parsing variance to reflect these subjective interpretations is critical for representing individual preferences.
- Partial moments are the *perfect* method to achieve this.
   Summary statistics just don't cut it!

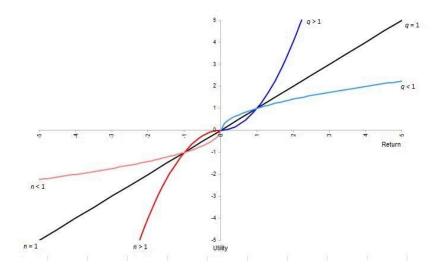

### Let's Revisit Degrees

$$LPM( extbf{n}, target, variable) = rac{1}{T} \sum_{t=1}^{T} \left[ \max(0, target - variable_t) 
ight]^{ extbf{n}}$$

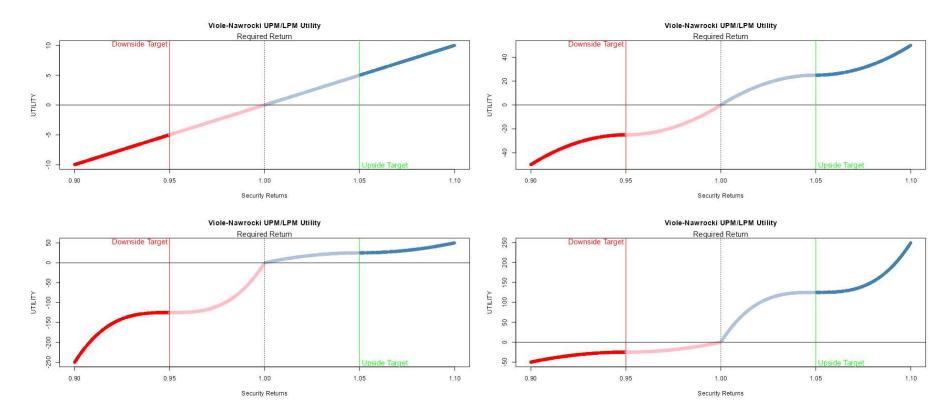

$$UPM( extbf{ extit{q}}, target, variable) = rac{1}{T} \sum_{t=1}^{T} \left[ \max(0, variable_t - target) 
ight]^q$$

loss-aversion: *n* 

gain-seeking: q

### **Utility Functions**

NOBODY is linear (n = 1) wrt losses!

### **Utility Embedded Into Covariance Matrix**

```
Covariance Elements and Covariance Matrix
The covariance matrix (\Sigma) is equal to the sum of the co-partial moments matrices less the divergent partial moments matrices.
                                             \Sigma = CLPM + CUPM - DLPM - DUPM
 > cov.mtx = PM.matrix(LPM_degree = 1, UPM_degree = 1, target = 'mean', variable = cbind(x,y), pop_adj = TRUE)

### **Expected Partial Moments**

Longer post and paper link on conditioning returns via entropy proxies

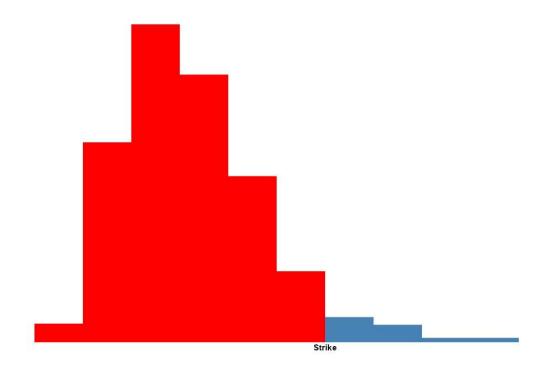

### Other Portfolio "Theories"

- Diversification for its own sake, with no identified utility function or preference being satisfied.
- Hierarchical Risk Parity (HRP) aims to create portfolios that are more robust to input variations, avoiding extreme meanvariance allocations.
- Stochastic Portfolio Theory (SPT) values growth rates but ignores investor preferences — how you achieve final wealth matters!

### **Options Pricing**

An obvious extension is to use UPM for calls and LPM for puts

No more N(d1) and N(d2)!

### Partial Moments in the Wild

To showcase the effectiveness of NNS in quantitative finance, I've designed the following applications:

- MacroNow nowcasting https://ovvo.shinyapps.io/macronow\_intro
- Options
   https://ovvo.shinyapps.io/options\_intro
- Portfolio
   https://ovvo.shinyapps.io/portfolio\_intro

### More Informed Dispersion Measures

$$RD_t = \sqrt{\sum_{i=1}^N w_i (R_{i,t} - R_{I,t})^2}$$

where  $R_{I,t} = \sum_{i=1}^{N} w_i R_{i,t}$  for N index members

$$RD_t^{ extit{LPM}} = \sqrt{\sum_{i=1}^N w_i [\max(0,R_{I,t}-R_{i,t})]^2}$$

$$RD_t^{UPM} = \sqrt{\sum_{i=1}^N w_i [\max(0,R_{i,t}-R_{I,t})]^2}$$

### **Better Stats to Arb**

#### Cumulative Returns of SPY and Account D\*\*\*

Alpha: 0.34 | Beta: -0.02 | Correlation: -0.04 | Sharpe: 1.98 SPY Max DD: 0.08 | Account Max DD: 0.09
